

CALIBR PRO [Plastic Tip] 2.0mL

510 Cart Filling Instructions

Filling Instructions

- **Step One:** The device comes with a cartridge and a separate mouthpiece. The mouthpiece will screw/unscrew from the top. Make sure to store the mouthpiece in a safe location while you are in the filling process.
- **Step Two:** Using either a syringe or eye dropper, fill the cartridge through the open top.
- **Step Three:** Screw the mouthpiece back on the device until it locks into place. Make sure to do this within 1.5 minutes of filling the device. For any other information.

After Filled

If you are using **Live Resin or **Live Rosin** then you can skip this step.*

- Once the device is filled and the mouthpiece has been placed back on within 1.5 minutes after filling. Invert the device so that is upside down.
- After the device has been flipped upside down for 30 minutes, flip it right side up for another 30 minutes. This allows the oil to fully saturate the coil. If the coil is not fully saturated, then it can potentially cause dry hits.

Additional Info

- Available in 0.5 mL, 1.0mL, & 2.0 mL.
- Filling needle must be 2.0 mm or less.
- Recommended pre-heat temperature should not exceed 122 degrees Fahrenheit.
- Make sure to cap the cartridge within 1.5 minutes after filling. For thinner consistencies, we recommend capping sooner than 1.5 minutes in order to prevent leaking.
- Storage temperatures should be between 68-77 degrees Fahrenheit.
- It is normal that after filling, the ceramic coil begins to absorb some oil and a headspace will be formed in the tank.
